Common Questions and Corresponding Answers from the Answer Key

Below are some typical questions found in the Ripple Tank Gizmo activities, along with summarized insights from the answer key.

- How does changing the frequency of the wave generator affect the wavelength?

Answer: Increasing the frequency decreases the wavelength, while decreasing the frequency increases the wavelength. This inverse relationship arises from the wave speed remaining constant in the medium; since $v = f \lambda$, where v is wave speed, f is frequency, and λ is wavelength.

- What is the pattern formed when two waves interfere constructively?

Answer: Constructive interference results in a wave with a larger amplitude, creating bright or high points in the ripple pattern. The wave peaks align, reinforcing each other.

- How does the presence of an obstacle affect wave propagation?

Answer: Obstacles cause diffraction, allowing waves to bend around edges. The pattern behind the obstacle often shows a shadow region with reduced amplitude, but waves spread into the shadow area due to diffraction.

- Describe how resonance occurs in the ripple tank.

Answer: Resonance happens when the frequency of the wave generator matches the natural frequency of the medium or a boundary, leading to increased amplitude and energy buildup. The answer key emphasizes the importance of matching frequencies to observe resonance effects.

- Why do standing waves form in the ripple tank?

Answer: Standing waves are formed when incident and reflected waves interfere constructively and destructively at specific points, creating nodes (points of no motion) and antinodes (points of maximum motion). The answer key highlights the importance of boundary conditions and wave reflection in this process.

Common Half-Life Gizmo Questions and Solutions

Understanding typical questions can prepare students to navigate the Gizmo effectively. Below are some frequently encountered problems along with detailed solutions.

Question 1: Calculating Remaining Radioactive Material

Problem:

A sample initially contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much

remains after 30 hours?

Solution:

The decay follows exponential decay formula:

$$ N = N_0 \times \left(\frac{1}{2}\right)^{t / T_{1/2}} $$

Where:

- $N_0 = 100$ grams
- $T_{1/2} = 10$ hours
- $t = 30$ hours

Calculations:

$$ N = 100 \times \left(\frac{1}{2}\right)^{30/10} = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams} $$

Answer:

12.5 grams of the isotope remain after 30 hours.

Question 2: Determining the Half-Life from Data

Problem:

A sample of a radioactive material decays from 80 grams to 20 grams in 24 hours. What is its half-life?

Solution:

The decay from 80g to 20g involves two half-lives:

$$ 80 \rightarrow 40 \rightarrow 20 $$

Number of half-lives: 2

Time for two half-lives: 24 hours

Therefore,

$$T_{1/2} = \frac{24 \text{ hours}}{2} = 12 \text{ hours}$$

Answer:

The half-life of the substance is 12 hours.

Question 3: Interpreting Decay Graphs

Problem:

Given a decay curve that shows the remaining amount of a substance over time, how can you estimate the half-life?

Solution:

Steps:

- Find the initial amount on the y-axis (N?).
- Locate the point where the remaining amount is approximately half of N?.
- Trace horizontally from this point to meet the decay curve, then go vertically down to the x-axis.
- The corresponding time on the x-axis is an estimate of the half-life.

Tip:

Using gridlines or digital tools can improve accuracy.

Tips for Mastering the Gizmo and Its Answers
